Chung-Hsuan Tung

Frontend Engineer

Email tionghian.tang@gmail.com | GitHub DongCX | LinkedIn

Profile

Frontend engineer with 8+ years of experience building products with React/TypeScript and Vue/Nuxt, spanning real-time features, SSR performance, SEO, and system migrations. Designed frontend modules, shipped changes in stages, and supported teammates through design and code reviews.

Technical Skills and Collaboration

Languages, frameworks and styling JavaScript, TypeScript, HTML/CSS, React, Vue, Nuxt 2/3, Tailwind CSS, UnoCSS, CSS Modules

Frontend architecture and integration Module and data flow design, rich-text editor design and integration (Tiptap), REST API/GraphQL/WebSocket integration, WebRTC and video SDK integration

Testing and automation Unit and component testing (Jest, Vitest, React Testing Library), workflow automation (Playwright)

Rendering, performance and SEO SSR strategies, hydration optimization, RWD/AWD development, Chrome Performance, PageSpeed, device-aware caching integration (CloudFront/Edge Cache), SEO and page structure optimization

Collaboration Mentorship, design and code reviews, task breakdown and knowledge transfer

Delivery New Relic error monitoring, CI/CD support, phased rollouts and risk assessment

Experience

AmazingTalker | Frontend Engineer

Feb 2017–Feb 2020, Oct 2020–Apr 2026 | Full-time

React interfaces and message integration | 2023–2024

An in-house support system connecting customer conversations with existing business workflows.

- Owned React/TypeScript frontend development for support chat across web and app interfaces. Helped replace the third-party support service and reduce vendor costs.
- Evaluated rich-text editors through POCs and selected Tiptap to support text, images, and attachments.
- Designed conversion between editor content and application messages. Migrated message handling and display in stages, supporting old and new formats with conversion and component tests.
- Led a three-person frontend team, including two junior engineers. Used design and code reviews to clarify component responsibilities, shared logic, and implementation tradeoffs, and help resolve development issues.

Performance profiling and data loading optimization | 2024

Core pages faced initialization bottlenecks and repeated data loading that delayed interaction.

- Used Chrome Performance to locate long tasks during page initialization. Introduced device-specific rendering (AWD) and collaborated on CloudFront/Edge Cache device handling for SSR/hydration consistency.
- Mobile PageSpeed tests of core pages showed up to approximately 53% lower average total blocking time (TBT).

AmazingTalker | Frontend Engineer

Real-time video and connection management | 2025–2026

A new livestreaming offering within the existing video product, supporting classes and audience interaction.

- Owned the React/TypeScript frontend architecture and development for a new livestreaming business module, integrating it with existing product workflows and collaborating with teammates to launch playback, chat, and polling features.
- Designed state and connection recovery mechanisms, separating service status from player state and handling player lifecycles and network failures.

Booking module refactoring and team delivery | 2024

Expanding lesson and booking flows had created tangled logic and increased maintenance overhead.

- Led booking module refactoring from proposal and technical research through architecture design and delivery, building a layered structure and reference implementations organized by lesson type, student/teacher role, and state.
- Planned phased delivery and handoffs for core platform features, accounting for workflow stability. Guided teammates through design and code reviews to refactor logic across product types and workflows and develop architectural design skills.

Data flow improvements and Nuxt 3 migration delivery | 2024–2025

A framework upgrade involving parallel services, data initialization, feature synchronization, and staged releases.

- Investigated Nuxt 2/3 initialization differences and improved data flow and state management to address cross-version compatibility, reduce initialization overhead, and avoid redundant data requests.
- Owned Nuxt 3 migration, validation, and deployment for pages within the team's scope. Paced rollouts using New Relic error signals and business risk, and supported contributors in resolving cross-version integration issues.
- Enabled existing CI synchronization checks for parallel development across versions and collaborated on runtime and dependency updates.

SEO and structured data | 2019, 2025

Shared search metadata and structured data to help search engines interpret page content.

- Built shared JSON-LD generation to centrally maintain structured data such as ratings and prices for course and teacher search pages. Adapted the initialization and output of metadata, Open Graph tags, and structured data during the Nuxt 3 migration.

Early product development and operations automation

Early product development and tools for recurring data maintenance and finance workflows.

- **Early product development** Helped rebuild the website with a Nuxt frontend separate from Rails, implementing core features including teacher search, student and teacher booking flows, chat, and the shopping cart.
- **Operations automation** Extended localization preview and selective-update workflows to reduce manual lookup and one-by-one updates. Used Playwright to automate downloading, naming, and archiving financial reports for recurring operations.

Fontech | Frontend Engineer (Full-time) | Feb 2020–Aug 2020

Education

Yuan Ze University | Bachelor's degree | 2012
